

Seed Journey

A three-minute story about care and consequence

CONCEPT ABSTRACT / 250 WORDS

Seed Journey is a three-minute, offline SwiftUI experience that turns plant care into a small story about balance, consequence, and responsibility. The user begins with one seed, physically drags it into the earth, covers it with a sweeping gesture, and awakens it through touch. Six choices then determine how the plant develops: water, sunlight, and wind can be applied in different combinations, each producing visible feedback and a final tree shaped by those decisions.

The experience addresses a simple learning problem: environmental systems are often explained as lists of facts rather than relationships. Seed Journey makes those relationships tangible. Too little water creates a dry tree, excess water floods the roots, harsh sunlight burns the leaves, and missing wind leaves the plant fragile. Balanced care rewards the player with a flourishing pink tree, while other reasonable combinations still produce a healthy result. Replay encourages experimentation without punishment.

Seed Journey is a strong fit for WWDC because it uses Apple platform capabilities as part of the storytelling. SwiftUI powers responsive stacks, layered scenery, transitions, and spring animations. DragGesture transforms planting into direct manipulation, sensory feedback gives important moments physical weight, Dynamic Type and accessibility labels support more users, and the Swift Observation framework keeps the experience state clear and testable. All imagery and synthesized ambient audio live inside the app, so the complete journey works without Wi-Fi, accounts, analytics, or external services. The result is focused, playful, technically deliberate, and achievable within a short session for curious learners everywhere to enjoy.

CORE LOOP

Plant -> Cover -> Care x6 -> Grow -> Reflect -> Replay
